

Project Executable Files

Date	15 March 2026
Team ID	XXXXXX
Project Name	SmartLender - Applicant Credibility Prediction for Loan Approval
Maximum Marks	3 Marks

Project Executable Files

This section contains the executable and deployable project submission details. The project is a machine-learning based loan approval solution that predicts applicant creditworthiness and supports faster, more consistent loan decisions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / dependency file	Yes
4	Database schema / seed files (if applicable)	N/A
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	N/A
7	APK / Executable binary (if applicable for mobile/desktop apps)	N/A
8	Dockerfile / Containerization config (if applicable)	N/A
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	N/A

Step 2: File / Folder Structure

Project structure:

project-root
src/ - Source code and Flask application files
models/ - Trained machine-learning model files
templates/ - HTML templates for the web interface
static/ - CSS, JavaScript and static assets
data/ - Dataset / processed data files
tests/ - Test files and validation scripts
config/ - Configuration files
README.md - Setup and run instructions
requirements.txt - Python dependencies
.env.example - Environment variable template

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	N/A - Local/project submission
Login Credentials (Demo)	N/A - No authentication credentials required for evaluation
Platform / Hosting Provider	Local development environment / optional Flask hosting
Repository Link	GitHub repository link to be added by the team
Demo Video Link	N/A / To be added if required

Step 4: Run Instructions

Pre-requisites:

Python 3.9+; pip; Git; a modern web browser; minimum 8 GB RAM recommended.

Step 1: Clone/download the project repository.

Step 2: Open a terminal in the project root directory.

Step 3: Create and activate a Python virtual environment.

Step 4: Install dependencies using **pip install -r requirements.txt**.

Step 5: Configure environment variables using **.env.example** as a reference.

Step 6: Ensure the trained ML model and required dataset/configuration files are available.

Step 7: Start the Flask application using the project's main application file (for example, **python app.py**).

Step 8: Open the local URL shown by Flask, commonly **http://127.0.0.1:5000**.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Prediction quality depends on the quality and representativeness of the training dataset.	Use validated data and retrain periodically.
2	The application is intended as a decision-support system and should not replace responsible human review.	Use model output together with appropriate lending review.
3	Production deployment requires secure environment configuration, monitoring and model governance.	Apply production security and monitoring before live deployment.
